# django-comments-xtd Documentation

Release 2.1.0

**Daniel Rus Morales** 

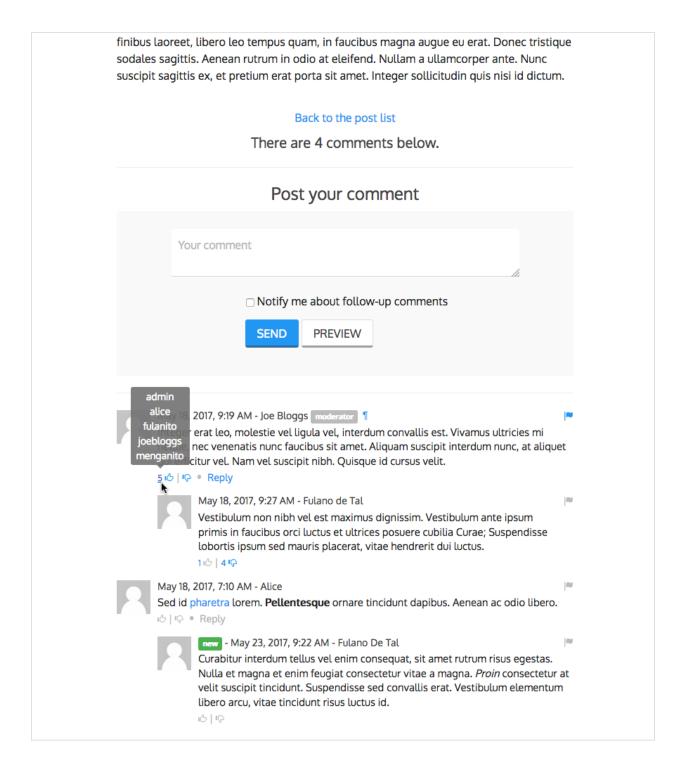

# Contents

1 Contents	3
Python Module Index	55
Index	57

A Django pluggable application that adds comments to your project. It extends the once official Django Comments Framework with the following features:

- 1. Thread support, so comments can be nested.
- 2. Customizable maximum thread level, either for all models or on a per app.model basis.
- 3. Optional notifications on follow-up comments via email.
- 4. Mute links to allow cancellation of follow-up notifications.
- 5. Comment confirmation via email when users are not authenticated.
- 6. Comments hit the database only after they have been confirmed.
- 7. Registered users can like/dislike comments and can suggest comments removal.
- 8. Template tags to list/render the last N comments posted to any given list of app.model pairs.
- 9. Emails sent through threads (can be disable to allow other solutions, like a Celery app).
- 10. Fully functional JavaScript plugin using ReactJS, jQuery, Bootstrap, Remarkable and MD5.

# CHAPTER 1

Contents

## 1.1 Quick start guide

To get started using django-comments-xtd follow these steps:

- 1. pip install django-comments-xtd
- 2. Enable the "sites" framework by adding 'django.contrib.sites' to INSTALLED\_APPS and defining SITE\_ID. Visit the admin site and be sure that the domain field of the Site instance points to the correct domain (localhost:8000 when running the default development server), as it will be used to create comment verification URLs, follow-up cancellations, etc.
- 3. Add 'django\_comments\_xtd' and 'django\_comments', in that order, to INSTALLED\_APPS.
- 4. Set the COMMENTS\_APP setting to 'django\_comments\_xtd'.
- 5. Set the COMMENTS\_XTD\_MAX\_THREAD\_LEVEL to N, being N the maximum level of threading up to which comments will be nested in your project.

```
# 0: No nested comments:
# Comment (level 0)
# 1: Nested up to level one:
# Comment (level 0)
# |-- Comment (level 1)
# 2: Nested up to level two:
# Comment (level 0)
# |-- Comment (level 1)
# |-- Comment (level 2)
COMMENTS_XTD_MAX_THREAD_LEVEL = 2
```

The thread level can also be established on a per <app>.<model> basis by using the COMMENTS\_XTD\_MAX\_THREAD\_LEVEL\_BY\_APP\_MODEL setting. Use it to establish different maximum threading levels for each model. ie: no nested comments for quotes, up to thread level 2 for blog stories, etc.

- 6. Set the COMMENTS\_XTD\_CONFIRM\_EMAIL to True to require comment confirmation by email for no logged-in users.
- 7. Run manage.py migrate to create the tables.
- 8. Add the URLs of the comments-xtd app to your project's urls.py:

```
urlpatterns = [
    ...
    url(r'^comments/', include('django_comments_xtd.urls')),
    ...
]
```

9. Customize your project's email settings:

```
EMAIL_HOST = "smtp.mail.com"
EMAIL_PORT = "587"
EMAIL_HOST_USER = "alias@mail.com"
EMAIL_HOST_PASSWORD = "yourpassword"
DEFAULT_FROM_EMAIL = "Helpdesk <helpdesk@yourdomain>"
```

- 10. As of version 1.7.1 django-comments-xtd comes with templates styled with twitter-bootstrap v3 to allow a quick start. If you want to build your own templates, use the comments templatetag module, provided by the django-comments app. Create a comments directory in your templates directory and copy the templates you want to customise from the Django Comments Framework. The following are the most important:
  - comments/list.html, used by the render\_comments\_list templatetag.
  - comments/form.html, used by the render\_comment\_form templatetag.
  - comments/preview.html, used to preview the comment or when there are errors submitting it.
  - comments/posted.html, which gets rendered after the comment is sent.
- 11. Add extra settings to control comments in your project. Check the available settings in the Django Comments Framework and in the *django-comments-xtd app*.

These are the steps to quickly start using django-comments-xtd. Follow to the next page, the *Tutorial*, to read a detailed guide that takes everything into account. In addition to the tutorial, the *Demo projects* implement several commenting applications.

## 1.2 Tutorial

This tutorial guides you through the steps to use every feature of django-comments-xtd together with the Django Comments Framework. The Django project used throughout the tutorial is available to download. Following the tutorial will take about an hour, and it is highly recommended to get a comprehensive understanding of django-comments-xtd.

### **Table of Contents**

- Introduction
- Preparation
- Configuration
  - Comment confirmation

- Comments tags
- Moderation
  - Disallow black listed domains
  - Moderate on bad words
- Threads
  - Different max thread levels
- Flags
  - Commenting options
  - Removal suggestion
    - \* Getting notifications
  - Liked it, Disliked it
    - \* Show the list of users
- Markdown
- JavaScript plugin
  - Enable Web API
  - Enable app.model options
  - The i18n JavaScript Catalog
  - Load the plugin
- Final notes

### 1.2.1 Introduction

Through the following sections the tutorial will cover the creation of a simple blog with stories to which we will add comments, exercising each and every feature provided by both, django-comments and django-comments-xtd, from comment post verification by mail to comment moderation and nested comments.

## 1.2.2 Preparation

Before we install any package we will set up a virtualenv and install everything we need in it.

By installing django-comments-xtd we install all its dependencies, Django and django-contrib-comments among them. So we are ready to work on the project. Take a look at the content of the tutorial directory, it contains:

• A **blog** app with a **Post** model. It uses two generic class-based views to list the posts and show a post in detail.

- The **templates** directory, with a **base.html** and **home.html**, and the templates for the blog app: **blog/post\_list.html** and **blog/post\_detail.html**.
- The **static** directory with a **css/bootstrap.min.css** file (this file is a static asset available, when the app is installed, under the path **django\_comments\_xtd/css/bootstrap.min.css**).
- The **tutorial** directory containing the **settings** and **urls** modules.
- And a **fixtures** directory with data files to create the *admin* superuser (with *admin* password), the default site and some blog posts.

Let's finish the initial setup, load the fixtures and run the development server:

```
(venv)$ python manage.py migrate
(venv)$ python manage.py loaddata fixtures/*.json
(venv)$ python manage.py runserver
```

Head to http://localhost:8000 and visit the tutorial site.

## 1.2.3 Configuration

Now that the project is running we are ready to add comments. Edit the settings module, tutorial/settings. py, and make the following changes:

```
INSTALLED_APPS = [
    ...
    'django_comments_xtd',
    'django_comments',
    'blog',
]
...

COMMENTS_APP = 'django_comments_xtd'

# Either enable sending mail messages to the console:
EMAIL_BACKEND = 'django.core.mail.backends.console.EmailBackend'

# Or set up the EMAIL_* settings so that Django can send emails:
EMAIL_HOST = "smtp.mail.com"
EMAIL_PORT = "587"
EMAIL_HOST_USER = "alias@mail.com"
EMAIL_HOST_PASSWORD = "yourpassword"
EMAIL_USE_TLS = True
DEFAULT_FROM_EMAIL = "Helpdesk <helpdesk@yourdomain>"
```

Edit the urls module of the project, tutorial/tutorial/urls.py and mount the URL patterns of django\_comments\_xtd in the path /comments/. The urls installed with django\_comments\_xtd include django\_comments' urls too:

```
from django.urls import include, path
urlpatterns = [
    ...
    path(r'comments/', include('django_comments_xtd.urls')),
    ...
]
```

Now let Django create the tables for the two new applications:

```
$ python manage.py migrate
```

Be sure that the domain field of the Site instance points to the correct domain, which for the development server is expected to be localhost:8000. The value is used to create comment verifications, follow-up cancellations, etc. Edit the site instance in the admin interface in case you were using a different value.

#### **Comment confirmation**

Before we go any further we need to set up the COMMENTS\_XTD\_SALT setting. This setting plays an important role during the comment confirmation by mail. It helps obfuscating the comment before the user approves its publication.

It is so because django-comments-xtd does not store comments in the server before they have been confirmed. This way there is little to none possible comment spam flooding in the database. Comments are encoded in URLs and sent for confirmation by mail. Only when the user clicks the confirmation URL the comment lands in the database.

This behaviour is disabled for authenticated users, and can be disabled for anonymous users too by simply setting COMMENTS\_XTD\_CONFIRM\_MAIL to False.

Now let's append the following entries to the tutorial settings module:

## 1.2.4 Comments tags

Next step consist of editing blog/post\_detail.html and loading the comments templatetag module after the extends tag:

```
{% extends "base.html" %}
{% load comments %}
```

Now we will change the blog post detail template to:

- 1. Show the number of comments posted to the blog story,
- 2. List the comments already posted, and
- 3. Show the comment form, so that comments can be sent.

By using the get\_comment\_count tag we will show the number of comments posted. Change the code around the link element to make it look as follows:

Now let's add the code to list the comments posted to the story. We can make use of two template tags, render\_comment\_list and get\_comment\_list. The former renders a template with the comments while the latter put the comment list in a variable in the context of the template.

When using the first, render\_comment\_list, with a blog.post object, Django will look for the template list.html in the following directories:

```
comments/blog/post/list.html
comments/blog/list.html
comments/list.html
```

Both, django-contrib-comments and django-comments-xtd, provide the last template of the list, comments/list. html. The one provided within django-comments-xtd comes with styling based on twitter-bootstrap.

Django will use the first template found depending on the order in which applications are listed in INSTALLED\_APPS. In this tutorial django-comments-xtd is listed first and therefore its comment/list.html template will be found first.

Let's modify the blog/post\_detail.html template to make use of the render\_comment\_list. Add the following code at the end of the page, before the endblock tag:

```
{% if comment_count %}
<hr/>
<hr/>
<div class="comments">
    {% render_comment_list for object %}
</div>
{% endif %}
```

Below the list of comments we want to display the comment form. There are two template tags available for that purpose, the render\_comment\_form and the get\_comment\_form. The former renders a template with the comment form while the latter puts the form in the context of the template giving more control over the fields.

We will use the first tag, render\_comment\_form. Again, add the following code before the endblock tag:

Finally, before completing this first set of changes, we could show the number of comments along with post titles in the blog's home page. For this we have to edit blog/post\_list.html and make the following changes:

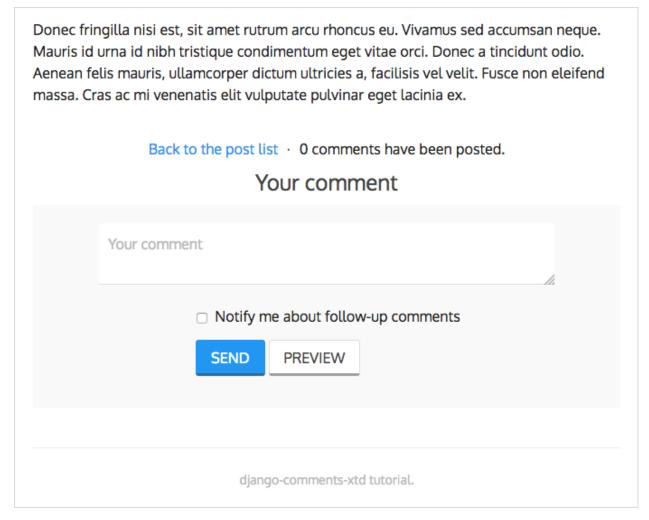

```
{% extends "base.html" %}
{% load comments %}

...

    {% get_comment_count for object as comment_count %}
    Published {{ object.publish }}
    {% if comment_count %}
    ⋅  {{ comment_count }} comments
    {% endif %}
```

Now we are ready to send comments. If you are logged in in the admin site, your comments won't need to be confirmed

by mail. To test the confirmation URL do logout of the admin interface. Bear in mind that EMAIL\_BACKEND is set up to send mail messages to the console, so look in the console after you post the comment and find the first long URL in the message. To confirm the comment copy the link and paste it in the location bar of the browser.

The setting COMMENTS\_XTD\_MAX\_THREAD\_LEVEL is 0 by default, which means comments can not be nested. Later in the threads section we will enable nested comments. Now we will set up comment moderation.

## 1.2.5 Moderation

One of the differences between django-comments-xtd and other commenting applications is the fact that by default it requires comment confirmation by email when users are not logged in, a very effective feature to discard unwanted comments. However there might be cases in which you would prefer a different approach. Django Comments Framework comes with moderation capabilities included upon which you can build your own comment filtering.

Comment moderation is often established to fight spam, but may be used for other purposes, like triggering actions based on comment content, rejecting comments based on how old is the subject being commented and whatnot.

In this section we want to set up comment moderation for our blog application, so that comments sent to a blog post older than a year will be automatically flagged for moderation. Also we want Django to send an email to registered MANAGERS of the project when the comment is flagged.

Let's start adding our email address to the MANAGERS in the tutorial/settings.py module:

```
MANAGERS = (
   ('Joe Bloggs', 'joe.bloggs@example.com'),
)
```

Now we will create a new Moderator class that inherits from Django Comments Frammework's CommentModerator. This class enables moderation by defining a number of class attributes. Read more about it in moderation options, in the official documentation of the Django Comments Framework.

We will also register our Moderator class with the django-comments-xtd's moderator object. We use django-comments-xtd's object instead of django-contrib-comments' because we still want to have confirmation by email for non-registered users, nested comments, follow-up notifications, etc.

Let's add those changes to the blog/model.py file:

```
# Append these imports below the current ones.

from django_comments.moderation import CommentModerator

from django_comments_xtd.moderation import moderator

...

# Add this code at the end of the file.

class PostCommentModerator(CommentModerator):
    email_notification = True
    auto_moderate_field = 'publish'
    moderate_after = 365

moderator.register(Post, PostCommentModerator)
```

That makes it, moderation is ready. Visit any of the blog posts with a publish datetime older than a year and try to send a comment. After confirming the comment you will see the django\_comments\_xtd/moderated.html template, and your comment will be put on hold for approval.

If on the other hand you send a comment to a blog post created within the last year your comment will not be put in moderation. Give it a try as a logged in user and as an anonymous user.

When sending a comment as a logged-in user the comment won't have to be confirmed and will be put in moderation immediately. However, when you send it as an anonymous user the comment will have to be confirmed by clicking on the confirmation link, immediately after that the comment will be put on hold pending for approval.

In both cases, due to the attribute email\_notification = True above, all mail addresses listed in the MANAGERS setting will receive a notification about the reception of a new comment. If you did not received such message, you might need to review your email settings, or the console output. Read about the mail settings above in the *Configuration* section. The mail message received is based on the comments/comment\_notification\_email.txt template provided with django-comments-xtd.

A last note on comment moderation: comments pending for moderation have to be reviewed and eventually approved. Don't forget to visit the comments-xtd app in the admin interface. Filter comments by *is public: No* and *is removed: No*. Tick the box of those you want to approve, choose **Approve selected comments** in the **action** dropdown, at the top left of the comment list, and click on the **Go** button.

## **Disallow black listed domains**

In case you wanted to disable comment confirmation by mail you might want to set up some sort of control to reject spam.

In this section we will go through the steps to disable comment confirmation while enabling a comment filtering solution based on Joe Wein's blacklist of spamming domains. We will also add a moderation function that will put in moderation comments containing badwords.

Let us first disable comment confirmation. Edit the tutorial/settings.py file and add:

```
COMMENTS_XTD_CONFIRM_EMAIL = False
```

django-comments-xtd comes with a **Moderator** class that inherits from CommentModerator and implements a method allow that will do the filtering for us. We just have to change blog/models.py and replace CommentModerator with SpamModerator, as follows:

Now we can add a domain to the BlackListed model in the admin interface. Or we could download a blacklist from Joe Wein's website and load the table with actual spamming domains.

Once we have a BlackListed domain, try to send a new comment and use an email address with such a domain. Be sure to log out before trying, otherwise django-comments-xtd will use the logged in user credentials and ignore the email given in the comment form.

Sending a comment with an email address of the blacklisted domain triggers a **Comment post not allowed** response, which would have been a HTTP 400 Bad Request response with DEBUG = False in production.

#### Moderate on bad words

Let's now create our own Moderator class by subclassing SpamModerator. The goal is to provide a moderate method that looks in the content of the comment and returns False whenever it finds a bad word in the message. The effect of returning False is that comment's is\_public attribute will be put to False and therefore the comment will be in moderation.

The blog application comes with a bad word list in the file blog/badwords.py

We assume we already have a list of BlackListed domains and we don't need further spam control. So we will disable comment confirmation by email. Edit the settings.py file:

```
COMMENTS_XTD_CONFIRM_EMAIL = False
```

Now edit blog/models.py and add the code corresponding to our new PostCommentModerator:

```
# Below the other imports:
from django_comments_xtd.moderation import moderator, SpamModerator
from blog.badwords import badwords
...

class PostCommentModerator(SpamModerator):
    email_notification = True

    def moderate(self, comment, content_object, request):
```

(continues on next page)

(continued from previous page)

```
# Make a dictionary where the keys are the words of the message and
        # the values are their relative position in the message.
        def clean(word):
            ret = word
            if word.startswith('.') or word.startswith(','):
                ret = word[1:]
            if word.endswith('.') or word.endswith(','):
                ret = word[:-1]
            return ret
        lowcase_comment = comment.comment.lower()
        msg = dict([(clean(w), i)
                    for i, w in enumerate(lowcase_comment.split())])
        for badword in badwords:
            if isinstance(badword, str):
                if lowcase_comment.find(badword) > -1:
                    return True
            else:
                lastindex = -1
                for subword in badword:
                    if subword in msq:
                        if lastindex > -1:
                            if msg[subword] == (lastindex + 1):
                                lastindex = msg[subword]
                        else:
                            lastindex = msg[subword]
                    else:
                        break
                if msg.get(badword[-1]) and msg[badword[-1]] == lastindex:
                    return True
        return super (PostCommentModerator, self).moderate(comment,
                                                           content_object,
                                                           request)
moderator.register(Post, PostCommentModerator)
```

Now we can try to send a comment with any of the bad words listed in badwords. After sending the comment we will see the content of the django\_comments\_xtd/moderated.html template and the comment will be put in moderation.

If you enable comment confirmation by email, the comment will be put on hold after the user clicks on the confirmation link in the email.

### 1.2.6 Threads

Up until this point in the tutorial django-comments-xtd has been configured to disallow nested comments. Every comment is at thread level 0. It is so because by default the setting <code>COMMENTS\_XTD\_MAX\_THREAD\_LEVEL</code> is set to 0.

When the COMMENTS\_XTD\_MAX\_THREAD\_LEVEL is greater than 0, comments below the maximum thread level may receive replies that will nest inside each other up to the maximum thread level. A comment in a the thread level below the COMMENTS\_XTD\_MAX\_THREAD\_LEVEL can show a **Reply** link that allows users to send nested comments.

In this section we will enable nested comments by modifying COMMENTS\_XTD\_MAX\_THREAD\_LEVEL and apply some changes to our blog\_detail.html template.

We can make use of two template tags, render\_xtdcomment\_tree and get\_xtdcomment\_tree. The former renders a template with the comments while the latter put the comments in a nested data structure in the context of the template.

We will also introduce the setting COMMENTS\_XTD\_LIST\_ORDER, that allows altering the default order in which the comments are sorted in the list. By default comments are sorted by thread and their position inside the thread, which turns out to be in ascending datetime of arrival. In this example we will list newer comments first.

Let's start by editing tutorial/settings.py to set up the maximum thread level to 1 and a comment ordering such that newer comments are retrieve first:

```
COMMENTS_XTD_MAX_THREAD_LEVEL = 1  # default is 0

COMMENTS_XTD_LIST_ORDER = ('-thread_id', 'order')  # default is ('thread_id', 'order')
```

Now we have to modify the blog post detail template to load the comments\_xtd templatetag and make use of render\_xtdcomment\_tree. We also want to move the comment form from the bottom of the page to a more visible position right below the blog post, followed by the list of comments.

Edit blog/post\_detail.html to make it look like follows:

```
{% extends "base.html" %}
{% load comments %}
{% load comments xtd %}
{% block title %}{{ object.title }}{% endblock %}
{% block content %}
<h3 class="page-header text-center">{{ object.title }}</h3>
{{ object.publish|date:"l, j F Y" }}
<q>
 {{ object.body|linebreaks }}
</p>
{% get_comment_count for object as comment_count %}
<div class="text-center" style="padding-top:20px">
 <a href="{% url 'blog:post-list' %}">Back to the post list</a>
   ⋅  
 {{ comment_count }} comments have been posted.
</div>
{% if object.allow_comments %}
<div class="comment">
 <h4 class="text-center">Your comment</h4>
 <div class="well">
   {% render_comment_form for object %}
 </div>
</div>
{% endif %}
{% if comment_count %}
<hr/>
class="media-list">
 {% render_xtdcomment_tree for object %}
{ % endif % }
{% endblock %}
```

The tag render\_xtdcomment\_tree renders the template django\_comments\_xtd/comment\_tree.

html.

Now visit any of the blog posts to which you have already sent comments and see that a new *Reply* link shows up below each comment. Click on the link and post a new comment. It will appear nested inside the parent comment. The new comment will not show a *Reply* link because *COMMENTS\_XTD\_MAX\_THREAD\_LEVEL* has been set to 1. Raise it to 2 and reload the page to offer the chance to nest comments inside one level deeper.

May 18, 2017, 9:19 a.m. - Henry Gondorff moderator 1

Integer erat leo, molestie vel ligula vel, interdum convallis est. Vivamus ultricies mi neque, nec venenatis nunc faucibus sit amet. Aliquam suscipit interdum nunc, at aliquet dui efficitur vel. Nam vel suscipit nibh. Quisque id cursus velit.

May 18, 2017, 9:27 a.m. - Fulano de Tal

Vestibulum non nibh vel est maximus dignissim. Vestibulum ante ipsum primis in faucibus orci luctus et ultrices posuere cubilia Curae; Suspendisse lobortis ipsum sed mauris placerat, vitae hendrerit dui luctus.

May 18, 2017, 7:10 a.m. - Alice

#### Different max thread levels

There might be cases in which nested comments have a lot of sense and others in which we would prefer a plain comment sequence. We can handle both scenarios under the same Django project.

We just have to use both settings, <code>COMMENTS\_XTD\_MAX\_THREAD\_LEVEL</code> and <code>COMMENTS\_XTD\_MAX\_THREAD\_LEVEL\_BY\_APP\_MODEL</code>. The former establishes the default maximum thread level site wide, while the latter sets the maximum thread level on <code>app.model</code> basis.

If we wanted to disable nested comments site wide, and enable nested comments up to level one for blog posts, we would set it up as follows in our settings.py module:

```
COMMENTS_XTD_MAX_THREAD_LEVEL = 0 # site wide default

COMMENTS_XTD_MAX_THREAD_LEVEL_BY_APP_MODEL = {

# Objects of the app blog, model post, can be nested

# up to thread level 1.

'blog.post': 1,

}
```

## 1.2.7 Flags

The Django Comments Framework supports comment flagging, so comments can be flagged for:

- Removal suggestion, when a registered user suggests the removal of a comment.
- Moderator deletion, when a comment moderator marks the comment as deleted.
- Moderator approval, when a comment moderator sets the comment as approved.

django-comments-xtd expands flagging with two more flags:

- Liked it, when a registered user likes the comment.
- **Disliked it**, when a registered user dislikes the comment.

In this section we will see how to enable a user with the capacity to flag a comment for removal with the **Removal** suggestion flag, how to express likeability, conformity, acceptance or acknowledgement with the **Liked it** flag and the opposite with the **Disliked it** flag.

One important requirement to mark comments is that the user flagging must be authenticated. In other words, comments can not be flagged by anonymous users.

## **Commenting options**

As of version 2.0 of django-comments-xtd there is a new setting, <code>COMMENTS\_XTD\_APP\_MODEL\_OPTIONS</code>, that must be correctly setup to allow flagging. The purpose is to give an additional level of control about what action users can do on comments: flag them as inappropriate, like/dislike them, and retrieve the list of users who liked/disliked them.

It defaults to:

```
COMMENTS_XTD_APP_MODEL_OPTIONS = {
    'default': {
        'allow_flagging': False,
        'allow_feedback': False,
        'show_feedback': False,
    }
}
```

We will enable each option alongside the following sections.

## Removal suggestion

Enabling the comment removal flag is about including the **allow\_flagging** argument in the render\_xtdcomment\_tree template tag. Edit the blog/post\_detail.html template and append the argument:

```
...

    {% render_xtdcomment_tree for object allow_flagging %}
```

The allow\_flagging argument makes the templatetag populate a variable allow\_flagging = True in the context in which django\_comments\_xtd/comment\_tree.html is rendered. Edit now the settings module and enable the allow flagging option for the blog.post app.label pair:

```
COMMENTS_XTD_APP_MODEL_OPTIONS = {
   'blog.post': {
      'allow_flagging': True,
      'allow_feedback': False,
      'show_feedback': False,
   }
}
```

Now let's suggest a removal. First we need to login in the admin interface so that we are not an anonymous user. Then we can visit any of the blog posts we sent comments to. There is a flag at the right side of every comment's header. Clicking on it bring the user to a page in which she is requested to confirm the removal suggestion. Finally, clicking on the red **Flag** button confirms the request.

Users with the django\_comments.can\_moderate permission will see a yellow labelled counter near the flag button in each flagged comment, representing how many times comments have been flagged. Also notice that when a user flags a comment for removal the icon turns red for that user.

Administrators/moderators can find flagged comment entries in the admin interface, under the **Comment flags** model, within the Django Comments application.

## **Getting notifications**

A user might want to flag a comment on the basis of a violation of the site's terms of use, hate speech, racism or the like. To prevent a comment from staying published long after it has been flagged we might want to receive notifications on flagging events.

For such purpose django-comments-xtd provides the class **XtdCommentModerator**, which extends django-contrib-comments' **CommentModerator**.

In addition to all the options of its parent class, **XtdCommentModerator** offers the removal\_suggestion\_notification attribute, that when set to True makes Django send a mail to all the MANAGERS on every **Removal suggestion** flag created.

To see an example let's edit blog/models.py. If you are already using the class **SpamModerator**, which inherits from **XtdCommentModerator**, just add removal\_suggestion\_notification = True to your PostCommentModeration class. Otherwise add the following code:

```
from django_comments_xtd.moderation import moderator, XtdCommentModerator
...
class PostCommentModerator(XtdCommentModerator):
    removal_suggestion_notification = True
moderator.register(Post, PostCommentModerator)
```

Be sure that PostCommentModerator is the only moderation class registered for the Post model, and be sure as well that the MANAGERS setting contains a valid email address. The message sent is based on the django\_comments\_xtd/removal\_notification\_email.txt template, already provided within django-comments-xtd. After these changes flagging a comment with a **Removal suggestion** will trigger a notification by mail.

### Liked it, Disliked it

Django-comments-xtd adds two new flags: the Liked it and the Disliked it flags.

Unlike the **Removal suggestion** flag, the **Liked it** and **Disliked it** flags are mutually exclusive. A user can not like and dislike a comment at the same time. Users can like/dislike at any time but only the last action will prevail.

In this section we make changes to give our users the capacity to like or dislike comments. Following the same pattern as with the removal flag, enabling like/dislike buttons is about adding an argument to the render\_xtdcomment\_tree, the argument allow\_feedback. Edit the blog/post\_detail.html template and add the new argument:

```
   {% render_xtdcomment_tree for object allow_flagging allow_feedback %}
```

The allow\_feedback argument makes the templatetag populate a variable allow\_feedback = True in the context in which django\_comments\_xtd/comment\_tree.html is rendered. Edit the settings module and enable the allow\_feedback option for the blog.post app.label pair:

```
COMMENTS_XTD_APP_MODEL_OPTIONS = {
    'blog.post': {
        'allow_flagging': True,
        'allow_feedback': True,
        'show_feedback': False,
    }
}
```

The blog post detail template is ready to show the like/dislike buttons, refresh your browser.

Having the new like/dislike links in place, if we click on any of them we will end up in either the django\_comments\_xtd/like.html or the django\_comments\_xtd/dislike.html templates, which are meant to request the user a confirmation for the operation.

## Show the list of users

With the like/dislike buttons enabled we might as well consider to display the users who actually liked/disliked comments. Again addind an argument to the render\_xtdcomment\_tree will enable the feature. Change the blog/post\_detail.html and add the argument show\_feedback to the template tag:

1.2. Tutorial

(continues on next page)

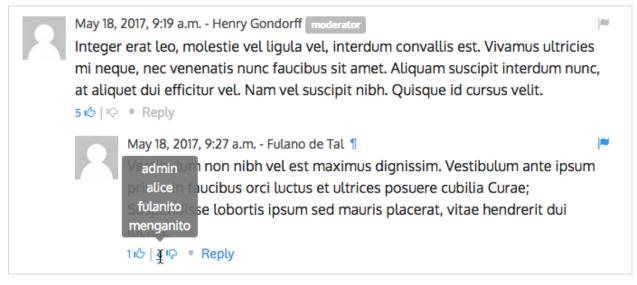

(continued from previous page)

```
$(function () {
  $('[data-toggle="tooltip"]').tooltip({html: true})
})</script>
{% endblock %}
```

Also change the settings and enable the show\_feedback option for blog.post:

```
COMMENTS_XTD_APP_MODEL_OPTIONS = {
    'blog.post': {
        'allow_flagging': True,
        'allow_feedback': True,
        'show_feedback': True,
    }
}
```

We loaded jQuery and twitter-bootstrap libraries from their respective default CDNs as the code above uses bootstrap's tooltip functionality to show the list of users when the mouse hovers the numbers near the buttons, as shows the image:

Put the mouse over the counters near the like/dislike buttons to display the list of users.

### 1.2.8 Markdown

In versions prior to 2.0 django-comments-xtd required the installation of django-markup as a dependency. There was also a specific template filter called render\_markup\_comment to help rendering comment's content in the markup language of choice.

As of version 2.0 the backend side of the application does not require the installation of any additional package to parser comments' content, and therefore does not provide the render\_markup\_comment filter anymore. However, in the client side the JavaScript plugin uses Markdown by default to render comments' content.

As for the backend side, comment's content is presented by default in plain text, but it is easily customizable by overriding the template includes/django\_comments\_xtd/render\_comment.html.

In this section we will send a Markdown formatted comment, and once published we will install support for Markdown, with django-markdown2. We'll then override the template mentioned above so that comments are interpreted as Markdown.

Send a comment formatted in Markdown, as the one in the following image.

May 18, 2017, 7:10 a.m. - Alice

Sed id [pharetra](https://www.example.com) lorem. \*\*Pellentesque\*\* ornare tincidunt dapibus. Aenean ac odio libero.

```
ı∂ | IP • Reply
```

Now we will install django-markdown2, and create the template directory and the template file:

```
(venv)$ pip install django-markdown2
(venv)$ mkdir -p templates/includes/django_comments_xtd/
(venv)$ touch templates/includes/django_comments_xtd/comment_content.html
```

We have to add django\_markdown2 to our INSTALLED\_APPS, and add the following template code to the file comment\_content.html we just created:

```
{% load md2 %}
{{ content|markdown:"safe, code-friendly, code-color" }}
```

Now our project is ready to show comments posted in Markdown. After reloading, the comment's page will look like this:

May 18, 2017, 7:10 a.m. - Alice

Sed id pharetra lorem. Pellentesque ornare tincidunt dapibus. Aenean ac odio libero.

```
16 | 10 • Reply
```

## 1.2.9 JavaScript plugin

Up until now we have used django-comments-xtd as a backend application. As of version 2.0 it includes a JavaScript plugin that helps moving part of the logic to the browser improving the overall usability. By making use of the JavaScript plugin users don't have to leave the blog post page to preview, submit or reply comments, or to like/dislike them. But it comes at the cost of using:

- · ReactJS
- jQuery (to handle Ajax calls).
- Twitter-Bootstrap (for the UI).
- Remarkable (for Markdown support).

To know more about the client side of the application and the build process read the specific page on the *JavaScript plugin*.

In this section of the tutorial we go through the steps to make use of the JavaScript plugin.

## **Enable Web API**

The JavaScript plugin uses the Web API provided by within the app. In order to enable it install the django-rest-framework:

```
(venv)$ pip install djangorestframework
```

Once installed, add it to our tutorial INSTALLED\_APPS setting:

```
INSTALLED_APPS = [
    ...
    'rest_framework',
    ...
]
```

To know more about the Web API provided by django-comments-xtd read on the Web API page.

## Enable app.model options

Be sure COMMENTS\_XTD\_APP\_MODEL\_OPTIONS includes the options we want to enable for comments sent to Blog posts. In this case we will allow users to flag comments for removal (allow\_flagging option), to like/dislike comments (allow\_feedback), and we want users to see the list of people who liked/disliked comments:

```
COMMENTS_XTD_APP_MODEL_OPTIONS = {
    'blog.post': {
        'allow_flagging': True,
        'allow_feedback': True,
        'show_feedback': True,
    }
}
```

## The i18n JavaScript Catalog

Internationalization support (see Internationalization) has been included within the plugin by making use of the Django's JavaScript i18n catalog. If your project doesn't need i18n you can easily remove every mention to these functions (namespaced under the *django* object) from the source and change the webpack.config.js file to build the plugin without it.

Our tutorial doesn't have i18n enabled (the comp example project has it), but we will not remove its support from the plugin, we will simply enable the JavaScript Catalog URL, so that the plugin can access its functions. Edit tutorial/urls.py and add the following url:

```
from django.views.i18n import JavaScriptCatalog

urlpatterns = [
    ...
    path(r'jsi18n/', JavaScriptCatalog.as_view(), name='javascript-catalog'),
]
```

In the next section we will use the new URL to load the i18n JavaScript catalog.

### Load the plugin

Now let's edit blog/post detail.html and make it look as follows:

```
{% extends "base.html" %}
{% load static %}
{% load comments %}
{% load comments_xtd %}

{% block title %}{{ object.title }}{% endblock %}

(continues on next page)
```

(continued from previous page)

```
{% block content %}
<h3 class="page-header text-center">{{ object.title }}</h3>
{{ object.publish|date:"l, j F Y" }}
<q>
 {{ object.body|linebreaks }}
</p>
<div class="text-center" style="padding-top:20px">
 <a href="{% url 'blog:post-list' %}">Back to the post list</a>
</div>
<div id="comments"></div>
{% endblock %}
{% block extra-js %}
<script>
 window.comments_props = {% get_commentbox_props for object %};
 window.comments_props_override = {
   allow_comments: {%if object.allow_comments%}true{%else%}false{%endif%},
   allow_feedback: true,
   show_feedback: true,
   allow_flagging: true,
   polling_interval: 5000 // In milliseconds.
 };
</script>
<script src="https://code.jquery.com/jquery-2.2.4.min.js"</pre>
       integrity="sha256-BbhdlvQf/xTY9qja0Dq3HiwQF8LaCRTXxZKRutelT44="
       crossorigin="anonymous"></script>
<script src="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.7/js/bootstrap.</pre>
⇔min.js"
       integrity="sha384-
→Tc5IQib027qvyjSMfHjOMaLkfuWVxZxUPnCJA712mCWNIpG9mGCD8wGNIcPD7Txa"
       crossorigin="anonymous"></script>
<script type="text/javascript"</pre>
       src="{% url 'javascript-catalog' %}"></script>
<script src="{% static 'django_comments_xtd/js/vendor-2.1.0.js' %}"></script>
<script src="{% static 'django_comments_xtd/js/plugin-2.1.0.js' %}"></script>
<script>
$(function () {
    $('[data-toggle="tooltip"]').tooltip({html: true})
}) </script>
{% endblock %}
```

The blog post page is now ready to handle comments through the JavaScript plugin, including the following features:

- 1. Post comments.
- 2. Preview comments, with instant preview update while typing.
- 3. Reply comment in the same page, with instant preview while typing.
- 4. Notifications of new incoming comments using active polling (override *polling\_interval* parameter, see the content of first *<script>* tag in the code above).
- 5. Button to reload the tree of comments, highlighting new comments (see image below).
- 6. Immediate like/dislike actions.

# There are 3 comments below. Post your comment Your comment Name Mail mail address Required for comment verification. ## 1.2.10 Final notes

We have reached the end of the tutorial. I hope you got enough to start using django-comments-xtd in your own project.

The following page introduces the **Demo projects**. The **simple** demo is a straightforward backend handled project that uses comment confirmation by mail, with follow-up notifications and mute links. The **custom** demo is an example about how to extend django-comments-xtd **Comment** model with new attributes. The **comp** demo shows a project using the complete set of features provided by both django-contrib-comments and django-comments-xtd.

Checkout the **Control Logic** page to understand how django-comments-xtd works along with django-contrib-comments. The **Web API** page details the API provided. The **JavaScript Plugin** covers every aspect regarding the frontend code. Read on **Filters and Template Tags** to see in detail the list of template tags and filters offered. The page on **Customizing django-comments-xtd** goes through the steps to extend the app with a quick example and little prose. Read the **Settings** page and the **Templates** page to get to know how you can customize the default behaviour and default look and feel.

If you want to help, please, report any bug or enhancement directly to the github page of the project. Your contributions are welcome.

## 1.3 Demo projects

There are three example projects available within django-comments-xtd:

- 1. **simple**: Provides non-threaded comment support to articles. It's an only-backend project, meant as a test case of the basic features (confirmation by mail, follow-up notifications, mute link).
- custom: Provides threaded comment support to articles using a new Comment class that inherits from django-comments-xtd's. The new comment model adds a title field to the XtdComment class. Find more details in Customizing django-comments-xtd.
- 3. comp: This example project provides comment support to several models, defining the maximum thread level on per app.model basis. It uses moderation, removal suggestion flag, like/dislike flags, and list of users who liked/disliked comments. Comment support for Articles are frontend based while comments for Quotes are backend based.

Visit the **example** directory within the repository in GitHub for a quick look.

#### **Table of Contents**

- Setup
- Simple project
- Custom project
- Comp project

## 1.3.1 Setup

The recommended way to run the demo sites is in its own virtualeny. Once in a new virtualeny, clone the code and cd into any of the 3 demo sites. Then run the migrate command and load the data in the fixtures directory:

1.3. Demo projects 23

```
$ virtualenv venv
$ source venv/bin/activate
(venv) $ git clone git://github.com/danirus/django-comments-xtd.git
(venv) $ cd django-comments-xtd/
(venv) $ python setup.py install
(venv) $ npm install
(venv) $ node_modules/webpack/bin/webpack.js -p
(venv) $ cd django_comments_xtd
(venv) $ django-admin compilemessages -1 fi
(venv) $ django-admin compilemessages -1 fr
(venv)$ django-admin compilemessages -l es
(venv)$ cd ../example/[simple|custom|comp]
(venv)$ pip install -r requirements.txt
(venv) $ python manage.py migrate
(venv)$ python manage.py loaddata ../fixtures/auth.json
(venv) $ python manage.py loaddata ../fixtures/sites.json
(venv)$ python manage.py loaddata ../fixtures/articles.json
(venv) $ # The **comp** example project needs quotes.json too:
(venv)$ python manage.py loaddata ../fixtures/quotes.json
(venv) $ python manage.py runserver
```

Example projects make use of the package django-markdown2, which in turn depends on Markdown2, to render comments using Markdown syntax.

## **Fixtures provide:**

- A User admin, with password admin.
- A default Site with domain localhost:8000 so that comment confirmation URLs are ready to hit the Django development web server.
- A couple of article objects to which the user can post comments.

By default mails are sent directly to the console using the console. EmailBackend. Comment out EMAIL\_BACKEND in the settings module to send actual mails. You will need to provide working values for all EMAIL\_\* settings.

## 1.3.2 Simple project

The simple example project features:

- 1. An Articles App, with a model Article whose instances accept comments.
- Confirmation by mail is required before the comment hit the database, unless COMMENTS\_XTD\_CONFIRM\_EMAIL is set to False. Authenticated users don't have to confirm comments.
- 3. Follow up notifications via mail.
- 4. Mute links to allow cancellation of follow-up notifications.
- 5. No nested comments.

This example project tests the initial features provided by django-comments-xtd. Setup the project as explained above.

## **Some hints:**

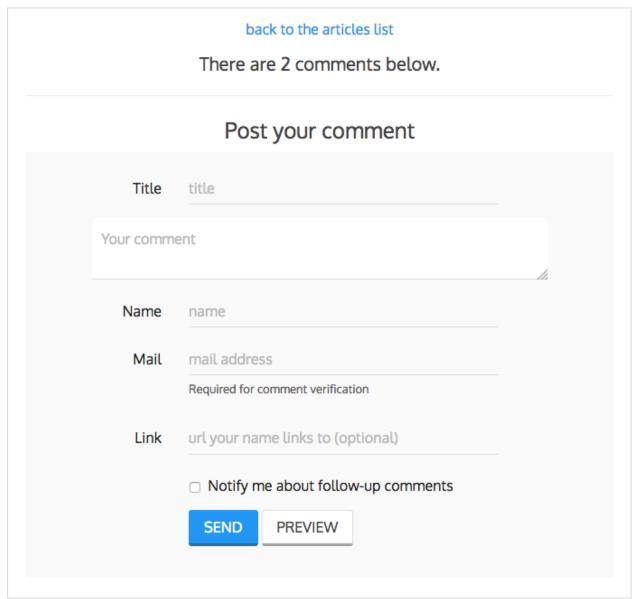

• Log out from the admin site to post comments, otherwise they will be automatically confirmed and no email will be sent.

- When adding new articles in the admin interface be sure to tick the box allow comments, otherwise comments won't be allowed.
- Send new comments with the Follow-up box ticked and a different email address. You won't receive
  follow-up notifications for comments posted from the same email address the new comment is being confirmed from.
- Click on the Mute link on the Follow-up notification email and send another comment. You will not receive further notifications.

## 1.3.3 Custom project

The **custom** example project extends the **simple** project functionality featuring:

- Thread support up to level 2
- A new comment class that inherits from XtdComment with a new Title field and a new form class.

1.3. Demo projects 25

## 1.3.4 Comp project

The Comp Demo implements two apps, each of which contains a model whose instances can received comments:

- App articles with the model Article
- App quotes with the model Quote

#### **Features:**

- 1. Comments can be nested, and the maximum thread level is established to 2.
- 2. Comment confirmation via mail when the users are not authenticated.
- 3. Comments hit the database only after they have been confirmed.
- 4. Follow up notifications via mail.
- 5. Mute links to allow cancellation of follow-up notifications.
- 6. Registered users can like/dislike comments and can suggest comments removal.
- 7. Registered users can see the list of users that liked/disliked comments.
- 8. The homepage presents the last 5 comments posted either to the articles. Article or the quotes. Quote model.

#### **Threaded comments**

The setting *COMMENTS\_XTD\_MAX\_THREAD\_LEVEL* is set to 2, meaning that comments may be threaded up to 2 levels below the first level (internally known as level 0):

```
First comment (level 0)
|-- Comment to "First comment" (level 1)
|-- Comment to "Comment to First comment" (level 2)
```

#### render xtdcomment tree

By using the <code>render\_xtdcomment\_tree</code> templatetag, both, <code>article\_detail.html</code> and <code>quote\_detail.html</code>, show the tree of comments posted. <code>article\_detail.html</code> makes use of the arguments <code>allow\_feedback</code>, <code>show\_feedback</code> and <code>allow\_flagging</code>, while <code>quote\_detail.html</code> only show the list of comments, with no extra arguments, so users can't flag comments for removal, and neither can submit like/dislike feedback.

#### render last xtdcomments

The **Last 5 Comments** shown in the block at the rigght uses the templatetag *render\_last\_xtdcomments* to show the last 5 comments posted to either *articles.Article* or *quotes.Quote* instances. The templatetag receives the list of pairs *app.model* from which we want to gather comments and shows the given N last instances posted. The templatetag renders the template *django\_comments\_xtd/comment.html* for each comment retrieve.

# 1.4 Control logic

Following is the application control logic described in 4 actions:

1. The user visits a page that accepts comments. Your app or a 3rd. party app handles the request:

- a. Your template shows content that accepts comments. It loads the comments templatetag and using tags as render\_comment\_list and render\_comment\_form the template shows the current list of comments and the *post your comment* form.
- 2. The user clicks on preview. Django Comments Framework post\_comment view handles the request:
- a. Renders comments/preview.html either with the comment preview or with form errors if any.
- 3. The user clicks on post. Django Comments Framework post\_comment view handles the request:
  - a. If there were form errors it does the same as in point 2.
  - Otherwise creates an instance of TmpXtdComment model: an in-memory representation of the comment.
  - c. Send signal comment\_will\_be\_posted and comment\_was\_posted. The django-comments-xtd receiver on\_comment\_was\_posted receives the second signal with the TmpXtdComment instance and does as follows:
    - If the user is authenticated or confirmation by email is not required (see *Settings*):
    - An instance of XtdComment hits the database.
    - An email notification is sent to previous comments followers telling them about the new
      comment following up theirs. Comment followers are those who ticked the box Notify me
      about follow up comments via email.
    - Otherwise a confirmation email is sent to the user with a link to confirm the comment. The link contains a secured token with the TmpXtdComment. See below *Creating the secure token for the confirmation URL*.
  - d. Pass control to the next parameter handler if any, or render the comments/posted.html template:
  - If the instance of XtdComment has already been created, redirect to the the comments's absolute URL.
  - Otherwise the template content should inform the user about the confirmation request sent by email.
- 4. The user **clicks on the confirmation link**, in the email message. *Django-comments-xtd* confirm view handles the request:
- a. Checks the secured token in the URL. If it's wrong returns a 404 code.
- b. Otherwise checks whether the comment was already confirmed, in such a case returns a 404 code.
- c. Otherwise sends a confirmation\_received signal. You can register a receiver to this signal to do some extra process before approving the comment. See *Signal and receiver*. If any receiver returns False the comment will be rejected and the template django\_comments\_xtd/discarded.html will be rendered.
- d. Otherwise an instance of XtdComment finally hits the database, and
- e. An email notification is sent to previous comments followers telling them about the new comment following up theirs.

# 1.4.1 Creating the secure token for the confirmation URL

The Confirmation URL sent by email to the user has a secured token with the comment. To create the token Django-comments-xtd uses the module signed.py authored by Simon Willison and provided in Django-OpenID.

django\_openid.signed offers two high level functions:

• dumps: Returns URL-safe, sha1 signed base64 compressed pickle of a given object.

1.4. Control logic 27

• loads: Reverse of dumps(), raises ValueError if signature fails.

#### A brief example:

```
>>> signed.dumps("hello")
'UydoZWxsbycKcDAKLg.QLtjWHYe7udYuZeQyLlafPqAx1E'
>>> signed.loads('UydoZWxsbycKcDAKLg.QLtjWHYe7udYuZeQyLlafPqAx1E')
'hello'
>>> signed.loads('UydoZWxsbycKcDAKLg.QLtjWHYe7udYuZeQyLlafPqAx1E-modified')
BadSignature: Signature failed: QLtjWHYe7udYuZeQyLlafPqAx1E-modified
```

There are two components in dump's output <code>UydoZWxsbycKcDAKLg.QLtjWHYe7udYuZeQyLlafPqAx1E</code>, separated by a '.'. The first component is a URLsafe base64 encoded pickle of the object passed to dumps(). The second component is a base64 encoded hmac/SHA1 hash of "\$first\_component.\$secret".

Calling signed.loads(s) checks the signature BEFORE unpickling the object -this protects against malformed pickle attacks. If the signature fails, a ValueError subclass is raised (actually a BadSignature).

## Signal and receiver

In addition to the signals sent by the Django Comments Framework, django-comments-xtd sends the following signal:

- **confirmation\_received**: Sent when the user clicks on the confirmation link and before the XtdComment instance is created in the database.
- comment\_thread\_muted: Sent when the user clicks on the mute link, in a follow-up notification.

## 1.4.2 Sample use of the confirmation\_received signal

You might want to register a receiver for confirmation\_received. An example function receiver could check the time stamp in which a user submitted a comment and the time stamp in which the confirmation URL has been clicked. If the difference between them is over 7 days we will discard the message with a graceful "sorry, it's a too old comment" template.

Extending the demo site with the following code will do the job:

(continued from previous page)

```
from datetime import timedelta #_

→ADD THIS

data = super(CommentForm, self).get_comment_create_data()
  data['followup'] = self.cleaned_data['followup']
  if settings.COMMENTS_XTD_CONFIRM_EMAIL:
    # comment must be verified before getting approved
    data['is_public'] = False
    data['submit_date'] = datetime.datetime.now() - timedelta(days=8) #_

→ADD THIS
  return data
```

Try the simple demo site again and see that the *django\_comments\_xtd/discarded.html* template is rendered after clicking on the confirmation URL.

#### **Maximum Thread Level**

Nested comments are disabled by default, to enable them use the following settings:

- COMMENTS\_XTD\_MAX\_THREAD\_LEVEL: an integer value
- COMMENTS\_XTD\_MAX\_THREAD\_LEVEL\_BY\_APP\_MODEL: a dictionary

Django-comments-xtd inherits the flexibility of django-contrib-comments framework, so that developers can plug it to support comments on as many models as they want in their projects. It is as suitable for one model based project, like comments posted to stories in a simple blog, as for a project with multiple applications and models.

The configuration of the maximum thread level on a simple project is done by declaring the COMMENTS\_XTD\_MAX\_THREAD\_LEVEL in the settings.py file:

```
COMMENTS_XTD_MAX_THREAD_LEVEL = 2
```

Comments then could be nested up to level 2:

Comments posted to instances of every model in the project will allow up to level 2 of threading.

On a project that allows users posting comments to instances of different models, the developer may want to declare a maximum thread level on a per app.model basis. For example, on an imaginary blog project with stories, quotes, diary entries and book/movie reviews, the developer might want to define a default, project wide, maximum thread level of 1 for any model and an specific maximum level of 5 for stories and quotes:

```
COMMENTS_XTD_MAX_THREAD_LEVEL = 1
COMMENTS_XTD_MAX_THREAD_LEVEL_BY_APP_MODEL = {
   'blog.story': 5,
   'blog.quote': 5,
}
```

So that blog.review and blog.diaryentry instances would support comments nested up to level 1, while blog.story and blog.quote instances would allow comments nested up to level 5.

1.4. Control logic 29

## 1.5 Web API

django-comments-xtd uses django-rest-framework to expose a Web API that provides developers with access to the same functionalities offered through the web user interface. The Web API has been designed to cover the needs required by the *JavaScript plugin*, and it's open to grow in the future to cover additional functionalities.

There are 5 methods available to perform the following actions:

- 1. Post a new comment.
- 2. Retrieve the list of comments posted to a given content type and object ID.
- 3. Retrieve the number of comments posted to a given content type and object ID.
- 4. Post user's like/dislike feedback.
- 5. Post user's removal suggestions.

#### **Table of Contents**

- Post a new comment
- Retrieve comment list
- Retrieve comments count
- Post like/dislike feedback
- Post removal suggestions

## 1.5.1 Post a new comment

URL name: comments-xtd-api-create

Mount point: <comments-mount-point>/api/comment/

HTTP Methods: POST

HTTP Responses: 201, 202, 204, 403

Serializer: django\_comments\_xtd.api.serializers.WriteCommentSerializer

This method expects the same fields submitted in a regular django-comments-xtd form. The serializer uses the function django\_comments.get\_form to verify data validity.

Meaning of the HTTP Response codes:

- 201: Comment created.
- 202: Comment in moderation.
- 204: Comment confirmation has been sent by mail.
- 403: Comment rejected, as in *Disallow black listed domains*.

## 1.5.2 Retrieve comment list

URL name: comments-xtd-api-list

Mount point: <comments-mount-point>/api/<content-type>/<object-pk>/

<content-type> is a hyphen separated lowecase pair app\_label-model

<object-pk> is an integer representing the object ID.

HTTP Methods: GET HTTP Responses: 200

 ${\bf Serializer: django\_comments\_xtd.api.serializers.ReadCommentSerializer}$ 

This method retrieves the list of comments posted to a given content type and object ID:

```
$ http://localhost:8000/comments/api/blog-post/4/
HTTP/1.0 200 OK
Allow: GET, HEAD, OPTIONS
Content-Length: 2707
Content-Type: application/json
Date: Tue, 23 May 2017 11:59:09 GMT
Server: WSGIServer/0.2 CPython/3.6.0
Vary: Accept, Cookie
X-Frame-Options: SAMEORIGIN
        "allow_reply": true,
        "comment": "Integer erat leo, ...",
        "flags": {
            "dislike": {
                "active": false,
                "users": []
            "like": {
                "active": false,
                "users": [
                    "1:admin",
                    "5:alice",
                    "2:fulanito",
                    "4:joebloggs",
                    "3:menganito"
                ]
            "removal": {
                "active": false,
                "count": null
        "id": 10,
        "is_removed": false,
        "level": 0,
        "parent_id": 10,
        "permalink": "/comments/cr/8/4/#c10",
        "submit_date": "May 18, 2017, 9:19 AM",
        "user_avatar": "http://www.gravatar.com/avatar/7dad9576 ...",
        "user_moderator": true,
        "user_name": "Joe Bloggs",
        "user_url": ""
    },
        . . .
```

1.5. Web API 31

## 1.5.3 Retrieve comments count

URL name: comments-xtd-api-count

Mount point: <comments-mount-point>/api/<content-type>/<object-pk>/count/

<content-type> is a hyphen separated lowecase pair app\_label-model

<object-pk> is an integer representing the object ID.

HTTP Methods: GET HTTP Responses: 200

Serializer: django\_comments\_xtd.api.serializers.ReadCommentSerializer

This method retrieves the number of comments posted to a given content type and object ID:

```
$ http http://localhost:8000/comments/api/blog-post/4/count/

HTTP/1.0 200 OK
Allow: GET, HEAD, OPTIONS
Content-Length: 11
Content-Type: application/json
Date: Tue, 23 May 2017 12:06:38 GMT
Server: WSGIServer/0.2 CPython/3.6.0
Vary: Accept, Cookie
X-Frame-Options: SAMEORIGIN

{
    "count": 4
}
```

## 1.5.4 Post like/dislike feedback

URL name: comments-xtd-api-feedback

Mount point: <comments-mount-point>/api/feedback/

HTTP Methods: POST

HTTP Responses: 201, 204, 403

Serializer: django\_comments\_xtd.api.serializers.FlagSerializer

This method toggles flags like/dislike for a comment. Successive calls set/unset the like/dislike flag:

```
$ http -a admin:admin POST http://localhost:8000/comments/api/feedback/_
comment=10 flag="like"

HTTP/1.0 201 Created
Allow: POST, OPTIONS
Content-Length: 34
Content-Type: application/json
Date: Tue, 23 May 2017 12:27:00 GMT
Server: WSGIServer/0.2 CPython/3.6.0
Vary: Accept, Cookie
X-Frame-Options: SAMEORIGIN

{
    "comment": 10,
    "flag": "I liked it"
}
```

Calling it again unsets the "I liked it" flag:

It requires the user to be logged in:

```
$ http POST http://localhost:8000/comments/api/feedback/ comment=10 flag=
    "like"

HTTP/1.0 403 Forbidden
Allow: POST, OPTIONS
Content-Length: 58
Content-Type: application/json
Date: Tue, 23 May 2017 12:27:31 GMT
Server: WSGIServer/0.2 CPython/3.6.0
Vary: Accept, Cookie
X-Frame-Options: SAMEORIGIN

{
    "detail": "Authentication credentials were not provided."
}
```

# 1.5.5 Post removal suggestions

URL name: comments-xtd-api-flag

Mount point: <comments-mount-point>/api/flag/

HTTP Methods: POST HTTP Responses: 201, 403

Serializer: django\_comments\_xtd.api.serializers.FlagSerializer

This method sets the *removal suggestion* flag on a comment. Once created for a given user successive calls return 201 but the flag object is not created again.

```
$ http POST http://localhost:8000/comments/api/flag/ comment=10 flag="report"

HTTP/1.0 201 Created
Allow: POST, OPTIONS
Content-Length: 42
Content-Type: application/json
Date: Tue, 23 May 2017 12:35:02 GMT
Server: WSGIServer/0.2 CPython/3.6.0
Vary: Accept, Cookie
X-Frame-Options: SAMEORIGIN

{
    "comment": 10,
    "flag": "removal suggestion"
}
```

1.5. Web API 33

As the previous method, it requires the user to be logged in.

# 1.6 JavaScript plugin

As of version 2.0 django-comments-xtd comes with a JavaScript plugin that enables comment support as in a Single Page Application fashion. Comments are loaded and sent in the background, as long as like/dislike opinions. There is an active verification, based on polling, that checks whether there are new incoming comments to show to the user, and an update button that allows the user to refresh the tree, highlighting new comments with a green label to indicate recently received comment entries.

# There are 3 comments below. Post your comment Your comment Name Mail mail address Required for comment verification. Link url your name links to (optional) ■ Notify me about follow-up comments SEND **PREVIEW UPDATE** May 18, 2017, 9:19 AM - Joe Bloggs moderator Integer erat leo, molestie vel ligula vel, interdum convallis est. Vivamus ultricies mi neque, nec venenatis nunc faucibus sit amet. Aliquam suscipit interdum nunc, at aliquet dui efficitur vel. Nam vel suscipit nibh. Quisque id cursus velit. 5 16 | 10 • Reply May 18, 2017, 9:27 AM - Fulano de Tal N Vestibulum non nibh vel est maximus dignissim. Vestibulum ante ipsum primis in faucibus orci luctus et ultrices posuere cubilia Curae; Suspendisse lobortis ipsum sed mauris placerat, vitae hendrerit dui luctus. 116 410 May 18, 2017, 7:10 AM - Alice N Sed id pharetra lorem. Pellentesque ornare tincidunt dapibus. Aenean ac odio libero. 16 | 10 ● Reply

This plugin is done by making choices that might not be the same you made in your own projects.

# 1.6.1 Frontend opinions

Django is a backend framework imposing little opinions regarding the frontend. It merely uses jQuery in the admin site. Nothing more. That leaves developers the choice to pick anything they want for the frontend to go along with the backend.

For backend developers the level of stability found in Python and Django contrasts with the active diversity of JavaScript libraries available for the frontend.

The JavaScript plugin included in the app is a mix of frontend decisions with the goal to provide a quick and full frontend solution. Doing so the app is ready to be plugged in a large number of backend projects, and in a reduced set of frontend stacks.

#### The JavaScript Plugin is based on:

- ReactJS
- jQuery (merely for Ajax)
- Remarkable (for Markdown markup support)
- Twitter-bootstrap (for the UI and the tooltip utility)

The build process is based on Webpack2 instead of any other as good a tool available in the JavaScript building tools landscape.

The decision of building a plugin based on these choices doesn't mean there can't be other ones. The project is open to improve its own range of JavaScript plugins through contributions. If you feel like improving the current plugin or providing additional ones, please, consider to integrate it using Webpack2 and try to keep the source code tree as clean and structured as possible.

## 1.6.2 Build process

In order to further develop the current plugin, fix potential bugs or install the the plugin from the sources, you have to use NodeJS and NPM.

### Set up the backend

Before installing the frontend dependencies we will prepare a Python virtualenv in which we will have all the backend dependencies installed. Let's start by creating the virtualenv and fetching the sources:

Check whether the app passes the battery of tests:

```
(django-comments-xtd) $ python setup.py test
```

As the sample Django project you can use the **comp** example site. Install first the django-markdown2 package (required by the comp example project) and setup the project:

```
(django-comments-xtd)$ cd example/comp
(django-comments-xtd)$ pip install django-markdown2
(django-comments-xtd)$ python manage.py migrate
(django-comments-xtd)$ python manage.py loaddata ../fixtures/auth.json
(django-comments-xtd)$ python manage.py loaddata ../fixtures/sites.json
(django-comments-xtd)$ python manage.py loaddata ../fixtures/articles.json
(django-comments-xtd)$ python manage.py runserver
```

Now the project is ready and the plugin will load from the existing bundle files. Check it out by visiting an article's page and sending some comments. No frontend source package has been installed so far.

### Install frontend packages

At this point open another terminal and cd into django-comments-xtd source directory again, then install all the frontend dependencies:

```
$ cd ~/src/django-comments-xtd
$ npm install
```

It will install all the dependencies listed in the **package.json** file in the local *node\_modules* directory. Once it's finished run webpack to build the bundles and watch for changes in the source tree:

```
$ webpack --watch
```

Webpack will put the bundles in the static directory of django-comments-xtd and Django will fetch them from there when rendering the article's detail page:

### 1.6.3 Code structure

Plugin sources live inside the **static** directory of django-comments-xtd:

The intial development was inspired by the ReactJS Comment Box tutorial. Component names reflect those of the ReactJS tutorial.

The application entry point is located inside the index.js file. The props passed to the **CommentBox** object are those declared in the var window.comments\_props defined in the django template:

```
<script>
  window.comments_props = {% get_commentbox_props for object %};
  window.comments_props_override = {
    allow_comments: {%if object.allow_comments%}true{%else%}false{%endif%},
    allow_feedback: true,
    show_feedback: true,
    allow_flagging: true,
    poll_interval: 2000,
    };
<//script>
```

And are overriden by those declared in the var window.comments\_props\_override.

# 1.6.4 Improvements and contributions

The current ReactJS plugin could be ported to an Inferno plugin within a reasonable timeframe. Inferno offers a lighter footprint compared to ReactJS plus it is among the faster JavaScript frontend frameworks.

Another improvement pending for implementation would be a websocket based update. At the moment comment updates are received by active polling. See commentbox.jsx, method load\_count of the CommentBox component.

Contributions are welcome, write me an email at mbox@danir.us or open an issue in the GitHub repository.

# 1.7 Filters and template tags

Django-comments-xtd provides 5 template tags and 3 filters. Load the module to make use of them in your templates:

```
{% load comments_xtd %}
```

### **Table of Contents**

- Tag render\_xtdcomment\_tree
- Tag get\_xtdcomment\_tree
- Tag render\_last\_xtdcomments
- Tag get\_last\_xtdcomments
- Tag get\_xtdcomment\_count
- Filter xtd comment gravatar
- Filter xtd\_comment\_gravatar\_url
- Filter render markup comment

### 1.7.1 Tag render xtdcomment tree

Tag syntax:

Renders the threaded structure of comments posted to the given object using the first template found from the list:

- django\_comments\_xtd/<app>/<model>/comment\_tree.html
- django\_comments\_xtd/<app>/comment\_tree.html
- django\_comments\_xtd/comment\_tree.html (provided with the app)

It expects either an object specified with the for <object> argument, or a variable named comments, which might be present in the context or received as comments=<comments-object>. When the for <object> argument is specified, it retrieves all the comments posted to the given object, ordered by the thread\_id and order within the thread, as stated by the setting COMMENTS\_XTD\_LIST\_ORDER.

It supports 4 optional arguments:

- allow\_flagging, enables the comment removal suggestion flag. Clicking on the removal suggestion flag redirects to the login view whenever the user is not authenticated.
- allow\_feedback, enables the like and dislike flags. Clicking on any of them redirects to the login view whenever the user is not authenticated.
- show\_feedback, shows two list of users, of those who like the comment and of those who don't like it. By overriding includes/django\_comments\_xtd/user\_feedback.html you could show the lists only to authenticated users.
- using <template\_path>, makes the templatetag use a different template, instead of the default one, django\_comments\_xtd/comment\_tree.html

### **Example usage**

In the usual scenario the tag is used in the object detail template, i.e.: blog/article\_detail.html, to include all comments posted to the article, in a tree structure:

### 1.7.2 Tag get\_xtdcomment\_tree

Tag syntax:

```
{% get_xtdcomment_tree for [object] as [varname] [with_feedback] %}
```

Returns a dictionary to the template context under the name given in [varname] with the comments posted to the given [object]. The dictionary has the form:

```
{
    'comment': xtdcomment_object,
    'children': [ list_of_child_xtdcomment_dicts ]
}
```

The comments will be ordered by the thread\_id and order within the thread, as stated by the setting COMMENTS\_XTD\_LIST\_ORDER.

When the optional argument with\_feedback is specified the returned dictionary will contain two additional attributes with the list of users who liked the comment and the list of users who disliked it:

```
{
    'xtdcomment': xtdcomment_object,
    'children': [ list_of_child_xtdcomment_dicts ],
    'likedit': [user_a, user_b, ...],
    'dislikedit': [user_n, user_m, ...]
}
```

### **Example usage**

Get an ordered dictionary with the comments posted to a given blog story and store the dictionary in a template context variabled called <code>comment\_tree</code>:

```
{% get_xtdcomment_tree for story as comments_tree with_feedback %}
```

# 1.7.3 Tag render\_last\_xtdcomments

Tag syntax:

```
{% render_last_xtdcomments [N] for [app].[model] [[app].[model] ...] %}
```

Renders the list of the last N comments for the given pairs <app>.<model> using the following search list for templates:

- django\_comments\_xtd/<app>/<model>/comment.html
- django\_comments\_xtd/<app>/comment.html
- django\_comments\_xtd/comment.html

### **Example usage**

Render the list of the last 5 comments posted, either to the blog.story model or to the blog.quote model. See it in action in the *Multiple Demo Site*, in the *blog homepage*, template blog/homepage.html:

```
{% render_last_xtdcomments 5 for blog.story blog.quote %}
```

### 1.7.4 Tag get\_last\_xtdcomments

Tag syntax:

```
{% get_last_xtdcomments [N] as [varname] for [app].[model] [[app].[model] ...] %}
```

Gets the list of the last N comments for the given pairs app. app

### **Example usage**

Get the list of the last 10 comments two models, Story and Quote, have received and store them in the context variable last\_10\_comment. You can then loop over the list with a for tag:

```
{% get_last_xtdcomments 10 as last_10_comments for blog.story blog.quote %}
{% if last_10_comments %}
    {% for comment in last_10_comments %}
        {{ comment.comment|linebreaks }}
        {% endfor %}
{% else %}
        No comments
{% endif %}
```

## 1.7.5 Tag get\_xtdcomment\_count

Tag syntax:

```
{% get_xtdcomment_count as [varname] for [app].[model] [[app].[model] ...] %}
```

Gets the comment count for the given pairs <app>.<model> and populates the template context with a variable containing that value, whose name is defined by the as clause.

### **Example usage**

Get the count of comments the model Story of the app blog have received, and store it in the context variable comment\_count:

```
{% get_xtdcomment_count as comment_count for blog.story %}
```

Get the count of comments two models, Story and Quote, have received and store it in the context variable comment count:

```
{% get_xtdcomment_count as comment_count for blog.story blog.quote %}
```

### 1.7.6 Filter xtd comment gravatar

Filter syntax:

```
{{ comment.email|xtd_comment_gravatar }}
```

A simple gravatar filter that inserts the gravatar image associated to an email address.

This filter has been named xtd\_comment\_gravatar as oposed to simply gravatar to avoid potential name collisions with other gravatar filters the user might have opted to include in the template.

### 1.7.7 Filter xtd comment gravatar url

Filter syntax:

```
{{ comment.email|xtd_comment_gravatar_url }}
```

A simple gravatar filter that inserts the gravatar URL associated to an email address.

This filter has been named xtd\_comment\_gravatar\_url as oposed to simply gravatar\_url to avoid potential name collisions with other gravatar filters the user might have opted to include in the template.

## 1.7.8 Filter render\_markup\_comment

Filter syntax:

```
{{ comment.comment|render_markup_comment }}
```

Renders a comment using a markup language specified in the first line of the comment. It uses django-markup to parse the comments with a markup language parser and produce the corresponding output.

### **Example usage**

A comment posted with a content like:

```
#!markdown
An [example](http://url.com/ "Title")
```

Would be rendered as a markdown text, producing the output:

```
<a href="http://url.com/" title="Title">example</a>
```

Available markup languages are:

- Markdown, when starting the comment with #!markdown.
- reStructuredText, when starting the comment with #! restructuredtext.
- Linebreaks, when starting the comment with #!linebreaks.

# 1.8 Migrating to django-comments-xtd

If your project uses django-contrib-comments you can easily plug django-comments-xtd to add extra functionalities like comment confirmation by mail, comment threading and follow-up notifications.

This section describes how to make django-comments-xtd take over comments support in a project in which django-contrib-comments tables have received data already.

# 1.8.1 Preparation

First of all, install django-comments-xtd:

```
(venv)$ cd mysite
(venv)$ pip install django-comments-xtd
```

Then edit the settings module and change your <code>INSTALLED\_APPS</code> so that <code>django\_comments\_xtd</code> and <code>django\_comments</code> are listed in this order. Also change the <code>COMMENTS\_APP</code> and add the <code>EMAIL\_\*</code> settings to be able to send mail messages:

```
INSTALLED_APPS = [
    ...
    'django_comments_xtd',
    'django_comments',
    ...
]
...
COMMENTS_APP = 'django_comments_xtd'

# Either enable sending mail messages to the console:
EMAIL_BACKEND = 'django.core.mail.backends.console.EmailBackend'

# Or set up the EMAIL_* settings so that Django can send emails:
EMAIL_HOST = "smtp.mail.com"
EMAIL_PORT = "587"
EMAIL_HOST_USER = "alias@mail.com"
EMAIL_HOST_USER = "alias@mail.com"
EMAIL_HOST_PASSWORD = "yourpassword"
EMAIL_USE_TLS = True
DEFAULT_FROM_EMAIL = "Helpdesk <helpdesk@yourdomain>"
```

Edit the urls module of the project and mount django\_comments\_xtd's URLs in the path in which you had django\_comments' URLs, django\_comments\_xtd's URLs includes django\_comments':

```
from django.conf.urls import include, url
urlpatterns = [
    ...
    url(r'^comments/', include('django_comments_xtd.urls')),
    ...
]
```

Now create the tables for django-comments-xtd:

```
(venv)$ python manage.py migrate
```

## 1.8.2 Populate comment data

The following step will populate **XtdComment**'s table with data from the **Comment** model. For that purpose you can use the populate\_xtdcomments management command:

```
(venv)$ python manage.py populate_xtdcomments
Added 3468 XtdComment object(s).
```

You can pass as many DB connections as you have defined in DATABASES and the command will run in each of the databases, populating the **XtdComment**'s table with data from the comments table existing in each database.

Now the project is ready to handle comments with django-comments-xtd.

# 1.9 Customizing django-comments-xtd

django-comments-xtd can be extended in the same way as django-contrib-comments. There are three points to observe:

1. The setting COMMENTS\_APP must be 'django\_comments\_xtd'.

- 2. The setting COMMENTS\_XTD\_MODEL must be your model class name, i.e.: 'mycomments.models. MyComment'.
- 3. The setting COMMENTS\_XTD\_FORM\_CLASS must be your form class name, i.e.: 'mycomments.forms. MyCommentForm'.

In addition to that, write an admin.py module to see the new comment class in the admin interface. Inherit from django\_commensts\_xtd.admin.XtdCommentsAdmin. You might want to add your new comment fields to the comment list view, by rewriting the list\_display attribute of your admin class. Or change the details view customizing the fieldsets attribute.

### 1.9.1 Custom Comments Demo

The demo site custom\_comments available with the source code in GitHub (directory django\_comments\_xtd\demos\custom\_comments) implements a sample Django project with comments that extend django\_comments\_xtd with an additional field, a title.

#### settings Module

The settings.py module contains the following customizations:

```
INSTALLED_APPS = (
    # ...
    'django_comments_xtd',
    'django_comments',
    'articles',
    'mycomments',
    # ...
)

COMMENTS_APP = "django_comments_xtd"

COMMENTS_XTD_MODEL = 'mycomments.models.MyComment'

COMMENTS_XTD_FORM_CLASS = 'mycomments.forms.MyCommentForm'
```

#### models Module

The new class MyComment extends django\_comments\_xtd's XtdComment with a title field:

```
from django.db import models
from django_comments_xtd.models import XtdComment

class MyComment (XtdComment):
    title = models.CharField(max_length=256)
```

#### forms Module

The forms module extends XtdCommentForm and rewrites the method get\_comment\_create\_data:

```
from django import forms
from django.utils.translation import ugettext_lazy as _
from django_comments_xtd.forms import XtdCommentForm
```

(continues on next page)

(continued from previous page)

```
class MyCommentForm(XtdCommentForm):
    title = forms.CharField(
        max_length=256,
        widget=forms.TextInput(attrs={'placeholder': _('title')})
)

def get_comment_create_data(self):
    data = super(MyCommentForm, self).get_comment_create_data()
    data.update({'title': self.cleaned_data['title']})
    return data
```

#### admin Module

The admin module provides a new class MyCommentAdmin that inherits from XtdCommentsAdmin and customize some of its attributes to include the new field title:

```
from django.contrib import admin
from django.utils.translation import ugettext_lazy as _
from django_comments_xtd.admin import XtdCommentsAdmin
from custom_comments.mycomments.models import MyComment
class MyCommentAdmin (XtdCommentsAdmin):
    list_display = ('thread_level', 'title', 'cid', 'name', 'content_type',
                    'object_pk', 'submit_date', 'followup', 'is_public',
                    'is_removed')
    list_display_links = ('cid', 'title')
    fieldsets = (
                        {'fields': ('content_type', 'object_pk', 'site')}),
        (None,
        (_('Content'), {'fields': ('title', 'user', 'user_name', 'user_email',
                                  'user_url', 'comment', 'followup')}),
        (_('Metadata'), {'fields': ('submit_date', 'ip_address',
                                     'is_public', 'is_removed') }),
    )
admin.site.register(MyComment, MyCommentAdmin)
```

### **Templates**

You will need to customize the following templates:

- comments/form.html to include new fields.
- comments/preview.html to preview new fields.
- django\_comments\_xtd/email\_confirmation\_request.{txt|html} to add the new fields to the confirmation request, if it was necessary. This demo overrides them to include the title field in the mail.
- django\_comments\_xtd/comments\_tree.html to show the new field when displaying the comments. If your project doesn't allow nested comments you can use either this template or *comments/list.html*'.

• django\_comments\_xtd/reply.html to show the new field when displaying the comment the user is replying to.

# 1.10 Internationalization

django-comments-xtd is i18n ready. Please, consider extending support for your language if it's not listed below. At the moment it's available only in:

- English, en (default language)
- Finnish, fi
- French, fr
- · Spanish, es

### 1.10.1 Contributions

This is a step by step guide to help extending the internationalization of django-comments-xtd. Install the **comp** example site. It will be used along with django-rosetta to help with translations.

```
$ virtualenv venv
$ source venv/bin/activate
(venv) $ git clone git://github.com/danirus/django-comments-xtd.git
(venv) $ cd django-comments-xtd/example/comp
(venv) $ pip install django-rosetta django-markdown2
(venv) $ python manage.py migrate
(venv) $ python manage.py loaddata ../fixtures/auth.json
(venv) $ python manage.py loaddata ../fixtures/sites.json
(venv) $ python manage.py loaddata ../fixtures/articles.json
(venv) $ python manage.py loaddata ../fixtures/quotes.json
(venv) $ python manage.py runserver
```

Edit the **comp/settings.py** module. Add the ISO-639-1 code of the language you want to support to LANGUAGES and add 'rosetta' to your INSTALLED\_APPS.

```
LANGUAGES = (
    ('en', 'English'),
    ('fi', 'Finnish'),
    ('fr', 'French'),
    ('es', 'Spanish'),
    ...
)

INSTALLED_APPS = [
    ...
    'rosetta',
    ...
]
```

**Note:** When django-rosetta is enabled in the **comp** project, the homepage shows a selector to help switch languages. It uses the language\_tuple filter, located in the **comp\_filters.py** module, to show the language name in both, the translated form and the original language.

We have to create the translation catalog for the new language. Use the ISO-639-1 code to indicate the language. There are two catalogs to translate, one for the backend and one for the frontend.

The frontend catalog is produced out of the **plugin-X.Y.Z.js** file. It's a good idea to run the webpack --watch command if you change the messages in the sources of the plugin (placed in the **js/src/** directory). This way the plugin is built automatically and the Django makemessages command will fetch the new messages accordingly.

Keep the runserver command launched above running in one terminal and open another terminal to run the **makemes-sages** and **compilemessages** commands:

```
$ source venv/bin/activate
(venv) $ cd django-comments-xtd/django_comments_xtd
(venv) $ django-admin makemessages -1 de
(venv) $ django-admin makemessages -d djangojs -1 de
```

Now head to the rosetta page, under http://localhost:8000/rosetta/, do login with user admin and password admin, and proceed to translate the messages. Find the two catalogs for django-comments-xtd under the **Third Party** filter, at the top-right side of the page.

Django must have the catalogs compiled before the messages show up in the comp site. Run the compile message for that purpose:

```
(venv)$ django-admin compilemessages
```

The **comp** example site is now ready to show the messages in the new language. It's time to verify that the translation fits the UI. If everything looks good, please, make a Pull Request to add the new .po files to the upstream repository.

# 1.11 Settings

To use django-comments-xtd it is necessary to declare the COMMENTS\_APP setting in your project's settings module as:

```
COMMENTS_APP = "django_comments_xtd"
```

A number of additional settings are available to customize django-comments-xtd behaviour.

#### **Table of Contents**

- COMMENTS\_XTD\_MAX\_THREAD\_LEVEL
- COMMENTS\_XTD\_MAX\_THREAD\_LEVEL\_BY\_APP\_MODEL
- COMMENTS\_XTD\_CONFIRM\_EMAIL
- COMMENTS\_XTD\_FROM\_EMAIL
- COMMENTS\_XTD\_CONTACT\_EMAIL
- COMMENTS\_XTD\_FORM\_CLASS
- COMMENTS XTD MODEL
- COMMENTS\_XTD\_LIST\_ORDER
- COMMENTS\_XTD\_MARKUP\_FALLBACK\_FILTER
- COMMENTS\_XTD\_SALT
- COMMENTS XTD SEND HTML EMAIL

1.11. Settings 47

```
• COMMENTS_XTD_THREADED_EMAILS
```

- COMMENTS\_XTD\_APP\_MODEL\_OPTIONS
- COMMENTS\_XTD\_API\_USER\_REPR

### 1.11.1 COMMENTS\_XTD\_MAX\_THREAD\_LEVEL

**Optional**. Indicates the **Maximum thread level** for comments. In other words, whether comments can be nested. This setting established the default value for comments posted to instances of every model instance in Django. It can be overriden on per app.model basis using the <code>COMMENTS\_XTD\_MAX\_THREAD\_LEVEL\_BY\_APP\_MODEL</code>, introduced right after this section.

An example:

```
COMMENTS_XTD_MAX_THREAD_LEVEL = 8
```

It defaults to 0. What means nested comments are not permitted.

## 1.11.2 COMMENTS\_XTD\_MAX\_THREAD\_LEVEL\_BY\_APP\_MODEL

**Optional**. The **Maximum thread level on per app.model basis** is a dictionary with pairs *app\_label.model* as keys and the maximum thread level for comments posted to instances of those models as values. It allows definition of max comment thread level on a per *app\_label.model* basis.

An example:

```
COMMENTS_XTD_MAX_THREAD_LEVEL = 0

COMMENTS_XTD_MAX_THREAD_LEVEL_BY_APP_MODEL = {
    'projects.release': 2,
    'blog.stories': 8, 'blog.quotes': 8,
    'blog.diarydetail': 0 # not required as it defaults to COMMENTS_XTD_MAX_THREAD_

$\int LEVEL \]
}
```

In the example, comments posted to projects.release instances can go up to level 2:

```
First comment (level 0)
|-- Comment to "First comment" (level 1)
|-- Comment to "Comment to First comment" (level 2)
```

It defaults to { }. What means the maximum thread level is setup with COMMENTS\_XTD\_MAX\_THREAD\_LEVEL.

### 1.11.3 COMMENTS\_XTD\_CONFIRM\_EMAIL

**Optional.** It specifies the **confirm comment post by mail** setting, establishing whether a comment confirmation should be sent by mail. If set to True a confirmation message is sent to the user with a link on which she has to click to confirm the comment. If the user is already authenticated the confirmation is not sent and the comment is accepted, if no moderation has been setup up, with no further confirmation needed.

If is set to False, and no moderation has been set up to potentially discard it, the comment will be accepted.

Read about the *Moderation* topic in the tutorial.

An example:

```
COMMENTS_XTD_CONFIRM_EMAIL = True
```

It defaults to True.

### 1.11.4 COMMENTS XTD FROM EMAIL

**Optional.** It specifies the **from mail address** setting used in the *from* field when sending emails.

An example:

```
COMMENTS_XTD_FROM_EMAIL = "noreply@yoursite.com"
```

It defaults to settings.DEFAULT\_FROM\_EMAIL.

### 1.11.5 COMMENTS\_XTD\_CONTACT\_EMAIL

Optional. It specifies a \*\*contact mail address the user could use to get in touch with a helpdesk or support personnel. It's used in both templates, email\_confirmation\_request.txt and email\_confirmation\_request.html, from the templates/django\_comments\_xtd directory.

An example:

```
COMMENTS_XTD_FROM_EMAIL = "helpdesk@yoursite.com"
```

It defaults to settings.DEFAULT\_FROM\_EMAIL.

### 1.11.6 COMMENTS XTD FORM CLASS

**Optional**, form class to use when rendering comment forms. It's a string with the class path to the form class that will be used for comments.

An example:

```
COMMENTS_XTD_FORM_CLASS = "mycomments.forms.MyCommentForm"
```

It defaults to "django\_comments\_xtd.forms.XtdCommentForm".

### 1.11.7 COMMENTS XTD MODEL

**Optional**, represents the model class to use for comments. It's a string with the class path to the model that will be used for comments.

An example:

```
COMMENTS_XTD_MODEL = "mycomments.models.MyCommentModel"
```

Defaults to "django\_comments\_xtd.models.XtdComment".

1.11. Settings 49

### 1.11.8 COMMENTS XTD LIST ORDER

**Optional**, represents the field ordering in which comments are retrieve, a tuple with field names, used by the get\_queryset method of XtdComment model's manager.

It defaults to ('thread\_id', 'order')

## 1.11.9 COMMENTS XTD MARKUP FALLBACK FILTER

**Optional**, default filter to use when rendering comments. Indicates the default markup filter for comments. This value must be a key in the MARKUP\_FILTER setting. If not specified or None, comments that do not indicate an intended markup filter are simply returned as plain text.

An example:

```
COMMENTS_XTD_MARKUP_FALLBACK_FILTER = 'markdown'
```

It defaults to None.

### 1.11.10 COMMENTS\_XTD\_SALT

**Optional**, it is the **extra key to salt the comment form**. It establishes the bytes string extra\_key used by signed. dumps to salt the comment form hash, so that there an additional secret is in use to encode the comment before sending it for confirmation within a URL.

An example:

```
COMMENTS_XTD_SALT = 'G0h5gt073h6gH4p25GS2g5AQ25hTm256yGt134tMP5TgCX$&HKOYRV'
```

It defaults to an empty string.

## 1.11.11 COMMENTS\_XTD\_SEND\_HTML\_EMAIL

**Optional**, enable/disable HTML mail messages. This boolean setting establishes whether email messages have to be sent in HTML format. By the default messages are sent in both Text and HTML format. By disabling the setting, mail messages will be sent only in text format.

An example:

```
COMMENTS_XTD_SEND_HTML_EMAIL = False
```

It defaults to True.

### 1.11.12 COMMENTS XTD THREADED EMAILS

**Optional**, enable/disable sending mails in separated threads. For low traffic websites sending mails in separate threads is a fine solution. However, for medium to high traffic websites such overhead could be reduced by using other solutions, like a Celery application or any other detached from the request-response HTTP loop.

An example:

50

```
COMMENTS_XTD_THREADED_EMAILS = False
```

Defaults to True.

### 1.11.13 COMMENTS\_XTD\_APP\_MODEL\_OPTIONS

**Optional**. Allow enabling/disabling commenting options on per **app\_label.model** basis. The options available are the following:

- allow\_flagging: Allow registered users to flag comments as inappropriate.
- allow\_feedback: Allow registered users to like/dislike comments.
- show\_feedback: Allow django-comments-xtd to report the list of users who liked/disliked the comment. The representation of each user in the list depends on the next setting::COMMENTS\_XTD\_API\_USER\_REPR.

An example use:

```
COMMENTS_XTD_APP_MODEL_OPTIONS = {
    'blog.post': {
        'allow_flagging': True,
        'allow_feedback': True,
        'show_feedback': True,
    }
}
```

Defaults to:

```
COMMENTS_XTD_APP_MODEL_OPTIONS = {
    'default': {
        'allow_flagging': False,
        'allow_feedback': False,
        'show_feedback': False,
    }
}
```

### 1.11.14 COMMENTS\_XTD\_API\_USER\_REPR

**Optional**. Function that receives a user object and returns its string representation. It's used to produced the list of users who liked/disliked comments. By default it outputs the username, but it could perfectly return the full name:

```
COMMENTS_XTD_API_USER_REPR = lambda u: u.get_full_name()
```

Defaults to:

```
COMMENTS_XTD_API_USER_REPR = lambda u: u.username
```

# 1.12 Templates

This page details the list of templates provided by django-comments-xtd. They are located under the django\_comments\_xtd/ templates directory.

# **Table of Contents**

- email\_confirmation\_request
- comment tree.html

1.12. Templates 51

```
user_feedback.html
like.html
dislike.html
disliked.html
discarded.html
email_followup_comment
comment.html
posted.html
reply.html
muted.html
```

# 1.12.1 email\_confirmation\_request

As .html and .txt, this template represents the confirmation message sent to the user when the **Send** button is clicked to post a comment. Both templates are sent in a multipart message, or only in text format if the <code>COMMENTS\_XTD\_SEND\_HTML\_EMAIL</code> setting is set to False.

In the context of the template the following objects are expected:

- The site object (django-contrib-comments, and in turn django-comments-xtd, use the Django Sites Framework).
- The comment object.
- The confirmation\_url the user has to click on to confirm the comment.

### 1.12.2 comment\_tree.html

This template is rendered by the *Tag render\_xtdcomment\_tree* to represent the comments posted to an object.

In the context of the template the following objects are expected:

• A list of dictionaries called comments in which each element is a dictionary like:

```
{
    'comment': xtdcomment_object,
    'children': [ list_of_child_xtdcomment_dicts ]
}
```

Optionally the following objects can be present in the template:

- A boolean allow\_flagging to indicate whether the user will have the capacity to suggest comment removal.
- A boolean allow\_feedback to indicate whether the user will have the capacity to like/dislike comments. When True the special template user\_feedback.html will be rendered.

### 1.12.3 user feedback.html

This template is expected to be in the directory includes/django\_comments\_xtd/, and it provides a way to customized the look of the like and dislike buttons as long as the list of users who clicked on them. It is included from comment\_tree.html. The template is rendered only when the *Tag render\_xtdcomment\_tree* is used with the argument allow\_feedback.

In the context of the template is expected:

- The boolean variable show\_feedback, which will be set to True when passing the argument show\_feedback to the *Tag render\_xtdcomment\_tree*. If True the template will show the list of users who liked the comment and the list of those who disliked it.
- A comment item.

Look at the section *Show the list of users* to read on this particular topic.

#### 1.12.4 like.html

This template is rendered when the user clicks on the **like** button of a comment.

The context of the template expects:

- A boolean already\_liked\_it that indicates whether the user already clicked on the like button of this comment. In such a case, if the user submits the form a second time the liked-it flag is withdrawn.
- The comment subject to be liked.

### 1.12.5 liked.html

This template is rendered when the user click on the submit button of the form presented in the like.html template. The template is meant to thank the user for the feedback. The context for the template doesn't expect any specific object.

### 1.12.6 dislike.html

This template is rendered when the user clicks on the **dislike** button of a comment.

The context of the template expects:

- A boolean already\_disliked\_it that indicates whether the user already clicked on the dislike button for this comment. In such a case, if the user submits the form a second time the disliked-it flag is withdrawn.
- The comment subject to be liked.

#### 1.12.7 disliked.html

This template is rendered when the user click on the submit button of the form presented in the dislike.html template. The template is meant to thank the user for the feedback. The context for the template doesn't expect any specific object.

1.12. Templates 53

### 1.12.8 discarded.html

This template gets rendered if any receiver of the signal confirmation\_received returns False. Informs the user that the comment has been discarded. Read the subsection *Signal and receiver* in the **Control Logic** to know about the confirmation\_received signal.

### 1.12.9 email\_followup\_comment

As .html and .txt, this template represents the mail message sent when there is a new comment following up the user's. It's sent to the user who posted the comment that is being commented in a thread, or that arrived before the one being sent. To receive this email the user must tick the box *Notify me of follow up comments via email*.

The template expects the following objects in the context:

- The site object.
- The comment object about which users are being informed.
- The mute\_url to offer the notified user the chance to stop receiving notifications on new comments.

### 1.12.10 comment.html

This template is rendered under any of the following circumstances:

- When using the Tag render\_last\_xtdcomments.
- When a logged in user sends a comment via Ajax. The comment gets rendered immediately. JavaScript client side code still has toe handle the response.

### 1.12.11 posted.html

Rendered when a not authenticated user sends a comment. It informs the user that a confirmation message has been sent and that the link contained in the mail must be clicked to confirm the publication of the comment.

# 1.12.12 reply.html

Rendered when a user clicks on the **reply** link of a comment. Reply links are created with XtdComment. get\_reply\_url method. They show up below the text of each comment when they allow nested comments.

### 1.12.13 muted.html

Rendered when a user clicks on the **mute link** received in a follow-up notification message. It informs the user that the site will not send more notifications on new comments sent to the object.
